

## Fork Positioner for Forklifts

Forklift Fork Positioner - The fork positioner is a hydraulic apparatus which allows the driver to be able to control the lift truck without leaving the seat. They are made out of high quality materials and are meant to be able to endure the most demanding operations and work environments. Side shifting units have the extra ability to be able to laterally position the arms or the entire load in order to facilitate more precise lifting and placement in a faster and much more efficient manner.

The unique fork pocket design could enable the individual operating it to be able to securely swing the unit's blades without any fear of damaging the positioning cylinders. This allows the operator the option to either execute simultaneous or independent blade movement, depending on the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are necessary. Standard OEM carriages can be transformed into blade positioners on existing units.
